

# drop-kick

Microbio® Adhesive and Penetration Agent

## Microemulsion that improves the biological effectiveness of Pesticides, Foliar Fertilizers and the Biostimulant fluisan

A great adhesive and penetration agent which enhances the effect of the used mediums and significantly shortens the absorption time.

- Supports penetration into the sheet
- Keeps the spray cones together, preventing drift
- Good plant compatibility/tolerance
- No waiting-time
- Especially suitable in combination with fluisan
- Droplet size: 30-70 nanometres

### Composition

Ethoxylated Fatty Alcohols 30%, Plant Oil Derivatives 30%, Alkyl polyglycoside-Ester 10%, Solvent 5%, Water 25%

### Effects

**drop-kick** helps distribute the spray mixture better on the leaves of the cultures to be treated and consequently, stabilize them. The surface tension on the leaves is reduced and this enables the desired effects – in particular, the improved adhesion and penetration of the spray mixture. **drop-kick** unfolds its special effect for better wetting, especially at lower or reduced amounts of water expenditure.

### Application

To be applied together with common crop protection products foliar fertilizers and the **fluisan** biostimulant in agricultural crops, fruits, vegetable and ornamental plants.

**drop-kick** can be used in tank mixtures with all common pesticides. We recommend an application rate of 0.025% - equivalent to 25mL in 100L of water.

This goes perfectly with the **fluisan** biostimulant, which increases the metabolism of the plant and thus promotes the degradation of pesticide residues. **Available in a combination pack:**
